UP ERDFI Webinar on High Impact R&D through HPC

Objective: Develop Tools for Seismic Response Simulation

(Fault → Site → City → Structure → Component)

Fault to site earthquake motion propagation

Structure Response

City Response

Component Response

ANALYSIS: **FAULT** → **SITE** → CITY → STRUCTURE → COMPONENT

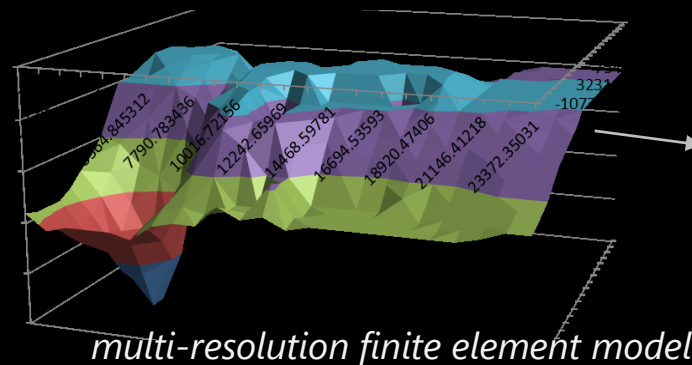

Fault to site earthquake motion propagation

surface topography modeling

crust layer interface modeling

multi-resolution finite element model

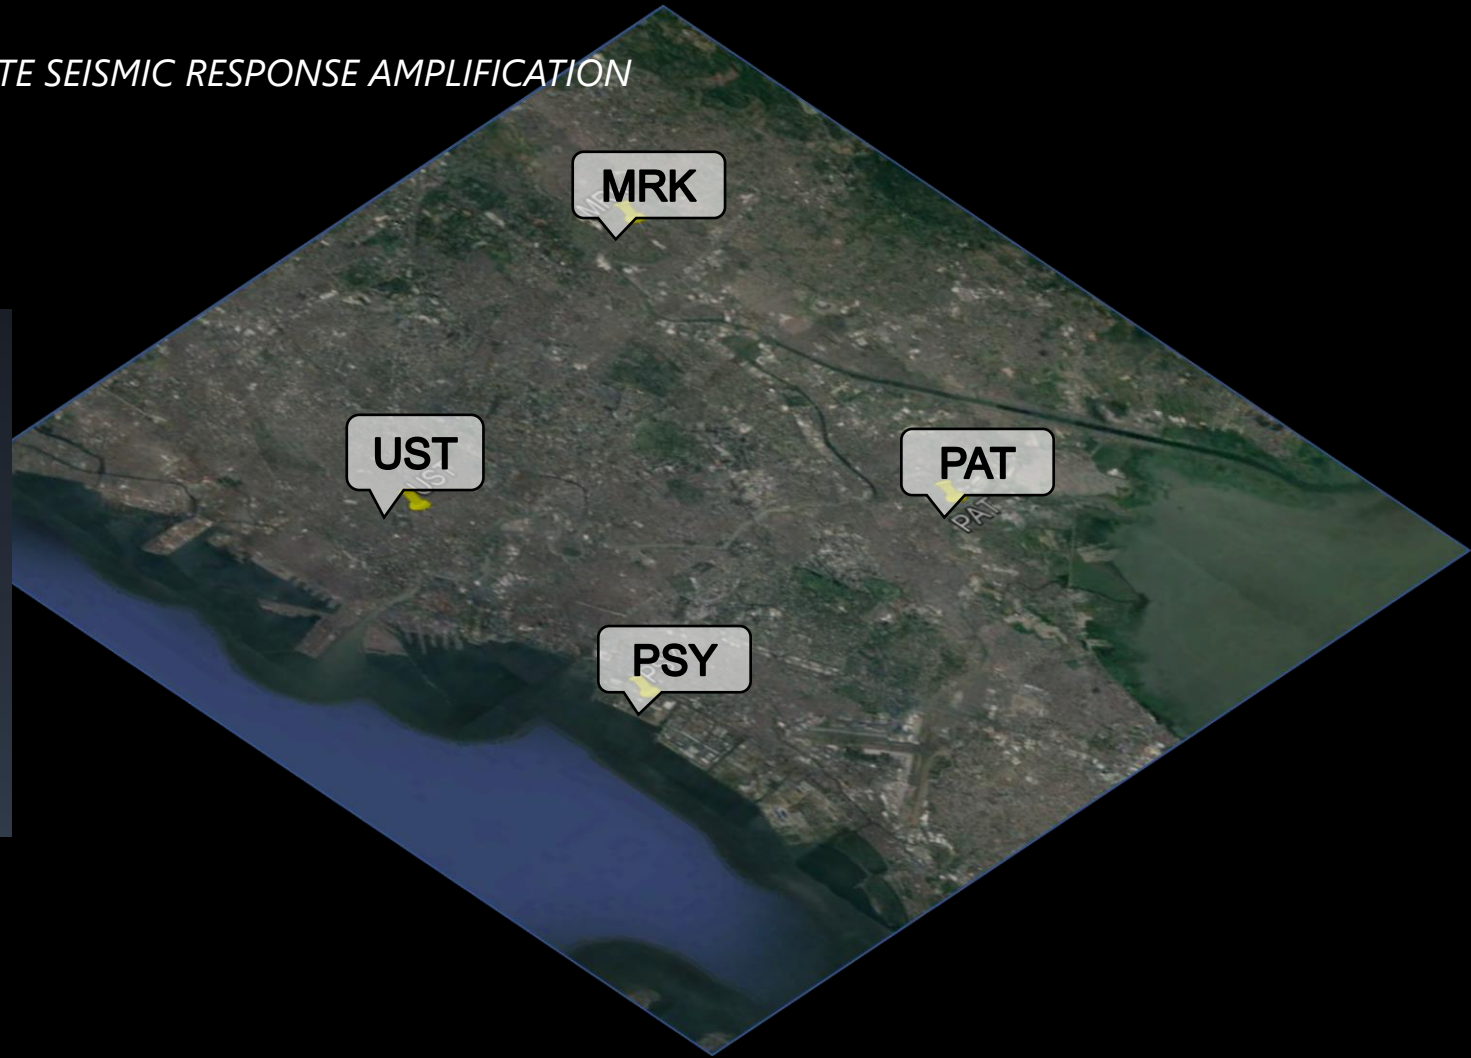

ANALYSIS: **FAULT → SITE** → CITY → STRUCTURE → COMPONENT

SITE SEISMIC RESPONSE AMPLIFICATION

APPLICATION: METRO MANILA AND NEARBY REGIONS

Finest resolution: 60 m

ANALYSIS: **FAULT → SITE** → CITY → STRUCTURE → COMPONENT

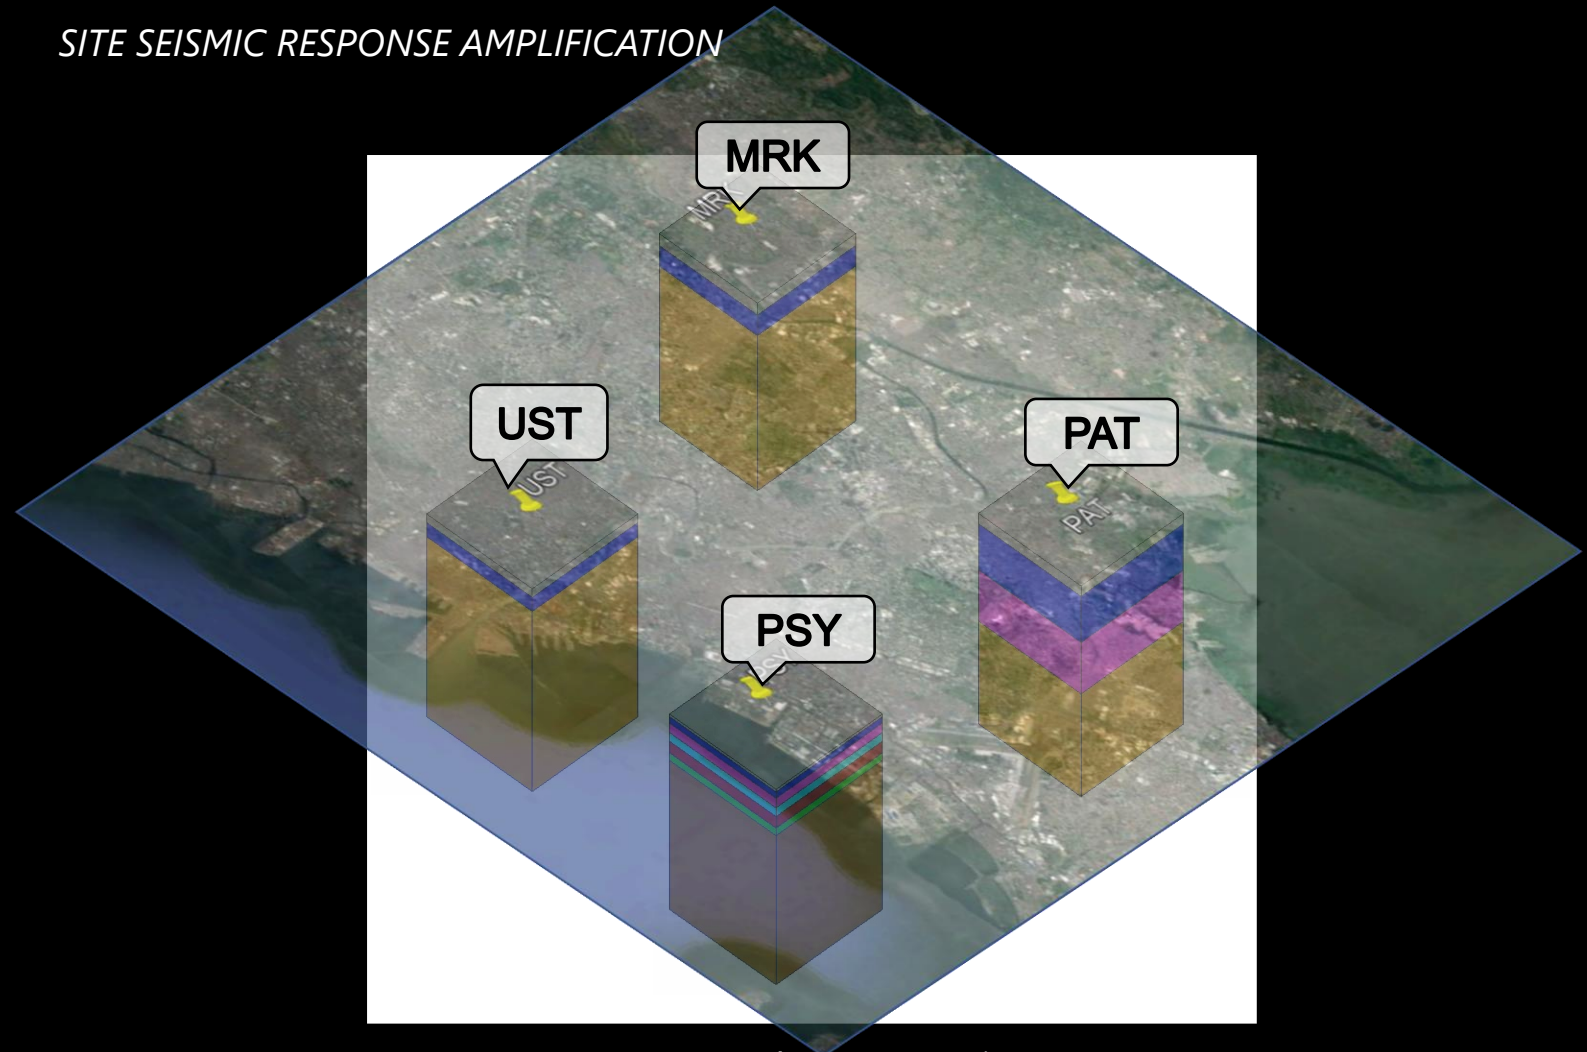

SCENARIO M7.2 WEST VALLEY FAULT EQ

Approx. 23 Million unknowns per time step
computed using 120 cores of DOST ASTI CoARE HPC

SITE SEISMIC RESPONSE AMPLIFICATION

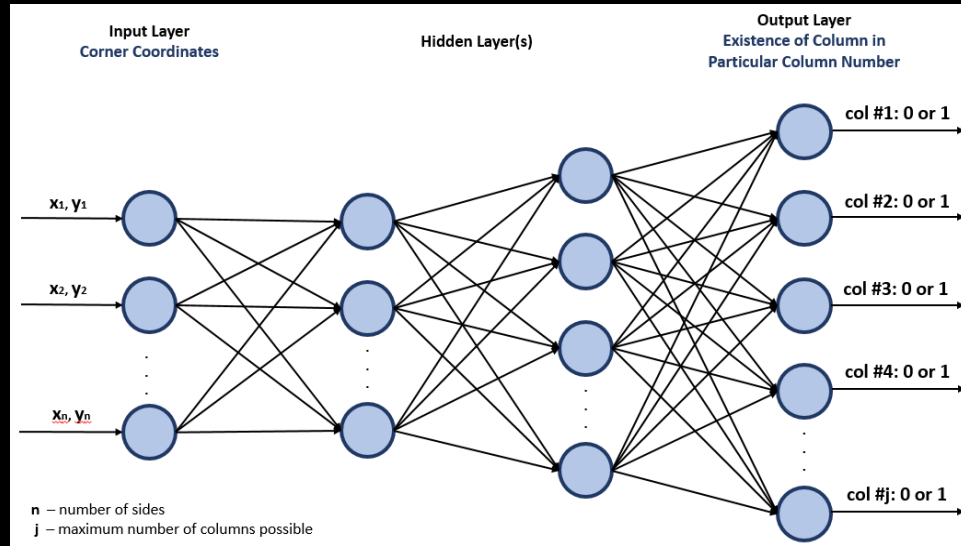

Approx. 500,000 unknowns per time step
computed using 2x2496 CUDA Cores of DOST ASTI
CoARE HPC

ANALYSIS: FAULT → SITE → CITY → STRUCTURE → COMPONENT

Building mesh

Frame model generation from feature data (assisted by ANN)

Generated frame models

Loading case

GIS (features)

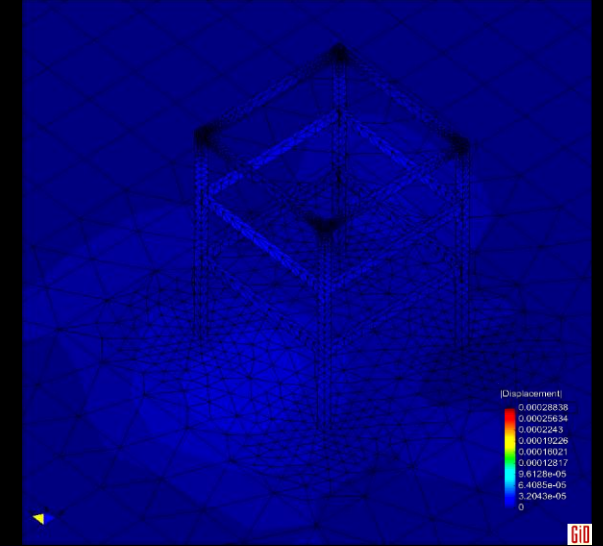

Story drift results

ANALYSIS: FAULT → SITE → CITY → **STRUCTURE** → COMPONENT

BIM representation

Finite Element Model

Building Response

ANALYSIS: FAULT → SITE → CITY → STRUCTURE → COMPONENT

Automated Finite Element Model Generation of Multiple Dual System Configurations

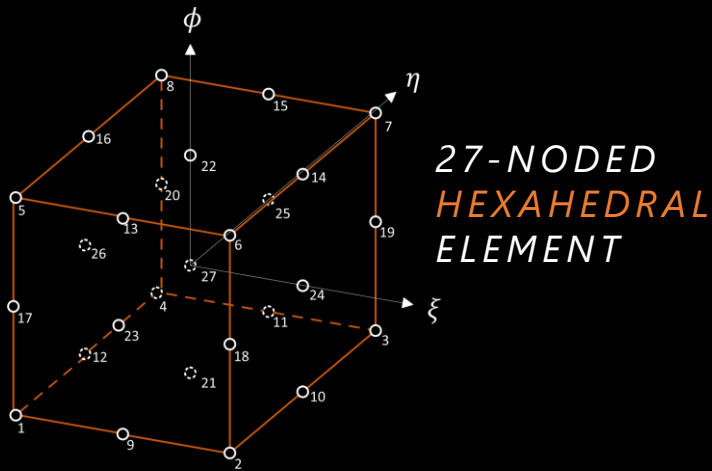

An multiresolution FEM model with 800,000 elements generated using quadtree + octree partitioning
Runtime: 10 minutes using a single core of DOST ASTI CoARE HPC

ANALYSIS: FAULT → SITE → CITY → STRUCTURE → COMPONENT

Deformation due to axial loading

*Approx. 27,423 unknowns to solve per loading step
Computation: 33 min DOST ASTI CoARE HPC with
OpenMP mutithreading*

Ongoing Work: Dynamic Analysis of Whole Metro Manila

(Approx. 1.4 Million target structures, or 350 Million unknowns per time step)

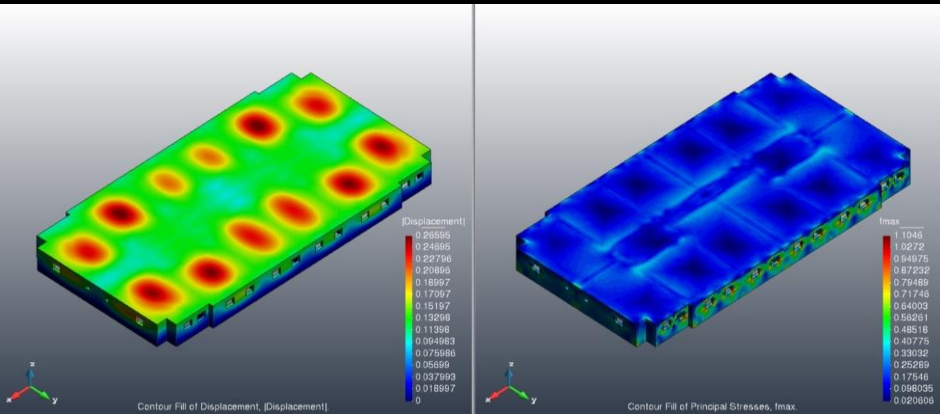

Estimated computation cost (one 40-sec EQ scenario simulation): 400 hours, 900 GB Memory

Ongoing Work: Integrated Visualization

Integration of BIM model, Finite Element Analysis results, Utilization model

*Building Response-Augmented Virtual Environment (BRAVE)
Postprocessing Tool*

(FE Analysis of approx. 800,000 unknowns per time step solved in 2.7 hours)

Ongoing Work: Dynamic Analysis of Infrastructure

(Approx. 760,000 unknowns per time step)

Estimated Computation cost (one 328-sec EQ scenario simulation): 35.5 hours

Concluding Remarks

- The availability of HPC resources has supported our team's research objective that focus on developing tools for simulating the various processes from fault-site-city-building-components.
- With the availability of HPC resources, we can implement and test new numerical and computing techniques to advance our research on hazard modeling, city and structural response analysis.
- HPC is not only computing with numbers. From it we can learn how to set the comprehensiveness of the models for the target application. It can harness creativity on how to address computationally costly operations. Being rooted in programming, it teaches patience, humility, and attention to detail.
